

Structure

(max) = read to the end of the item as character(s)

(n) = where 'n' describes the nature of that particular item like:

Floating point number	- The IEEE Standard for Floating-Point Arithmetic (binary32, single precision)
Integer number	- 32 bit, signed
Characters	- ANSI

Note: Integer & floating point numbers in this specification must have a valid value ie.: number and dot in case of floating point. There is only one exception to this rule: empty char like ' ' rendered 0 (ZERO) when converting to floating point.

1. line*

(A # character which indicates the beginning of a new record (can be useful if file corruption occurs) followed by the AWB number syntax : #<airline prefix><hyphen><the serial number>. For example: #182-15472903 [any deviation from this syntax is erroneous!])
#182-15472903

2. line*

(Nature of goods description. A maximum of 19 separated part containing up to 22 characters each! If there is no data at all, then only the 18 separator backslash)
DIFFERENT MEDICINES \AS PER ENCL. INVOICE \NOT RESTRICTED\////////////////////////////////

3. line
